

## **Digital Cameras for Vacations**

Vacationers no longer need to predetermine the number of film rolls, type, or ISO speed to pack. All one needs to do is be sure to have a good sized memory card in their digital camera to hold countless photos. Today's vacationers can take more pictures than ever. We now look for different features in our vacation cameras, and it best be digital. In the past, when returning from vacation we couldn't wait to take our film in to be developed. We would then need to wait a week or so to enjoy them -- Not to leave out the cost of the film and development, which is a huge savings for the vacationer using a digital camera. Photographs can now be viewed and printed immediately, a fun capability not previously available.

There are many digital cameras to choose from, but for this purpose you should look for one that's compact, easy to use, takes high quality photos, and has a good zoom lens. All these features are easy to find. Many digital cameras take better pictures than film cameras, especially since you can delete those you're not happy with to make room for other good ones. This means that all vacation pictures should be great, not blurry, nor too dark, nor too light -- Issues the film camera vacationer wouldn't learn about until receipt of the developed photos.

In addition to sufficient memory space, a consumer should be sure that their digital camera has a good battery and charger, a built in flash, a USB cable, various shutter speeds, is lightweight, has a hand strap, and includes a protective case to shield it during travel. With all those things in order, one should be able to take the best and most vacation photographs ever.
