

PC Laptops for Teenagers

First, it should be sturdy, not sleek and fancy. The first decision to be made is Mac or PC. Both are good, but PC's are more prevalent and a little better for compatibility purposes. Today, many laptops are competing against each other to be the smallest, the lightest, the most powerful, or the most attractive. For this purpose, you don't need to look for any of that. Teenagers mainly use laptops for school work, internet research related to the same, and possibly gaming if allowed.

The laptop should be durable, since teenagers can be somewhat hard on things. Parents probably shouldn't spend too much money on one either, as teenagers are also known to lose things. Given that laptops are portable, one can quickly be lost or stolen, if not properly cared for. Although it's not recommended that you purchase the top of the line, there are a few things that are important.

Memory, also known as RAM, should be relatively high. If it's too low or slow, homework may take twice as long, plus a slow speed can be frustrating to anyone. It should also have a reasonable amount of Hard Drive capacity to grow into. The battery should be long lasting – Remember, no battery juice, no use. Not all batteries are created equal.

Parents may need to spend about \$600+ dollars to purchase a decent laptop for a teenager. There are a few less in price and many more that are higher. And don't forget to save a few bucks for a good internet service provider, and the proper security blocks to protect your teenager from material on the internet you don't want them to see.
